EC2InstancesLaunch an instance

We'll create a new security group called 'launch-wizard-5' with the following rules:

☒ Allow SSH traffic from

Helps you connect to your instance

Anywhere0.0.0.0/0

☒ Allow HTTPS traffic from the internet

To set up an endpoint, for example when creating a web server

☒ Allow HTTP traffic from the internet

To set up an endpoint, for example when creating a web server

Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

▼ Configure storageInfoAdvanced

1x8GiBgp3Root volume 3000 IOPS (Not encrypted)

Free tier eligible customers can get up to 30 GB of EBS General Purpose (SSD) or Magnetic storage

Add new volume

The selected AMI contains more instance store volumes than the instance allows. Only the first 0 instance store volumes from the AMI will be accessible from the instance

Click refresh to view backup information

The tags that you assign determine whether the instance will be backed up by any Data Lifecycle Manager policies.

2025. 02. 19.

The screenshot displays the AWS Management Console for an EC2 instance. The instance is named 'i-070a7667ca4fe9ce3' and is currently in the 'Initializing' state. The console shows various tabs for configuration, including Networking, Storage, and Tags. A terminal window is open, showing the command 'ls -la' and its output, which lists files in the /home/ubuntu directory. The instance summary shows details like Instance ID, IP address, Hostname type, and IAM Role.

Instance Summary:

- Instance ID:** i-070a7667ca4fe9ce3
- IPV6 address:** -
- Hostname type:** IP name: ip-172-31-43-165.ec2.internal
- Answer private resource DNS name:** IPV4 (A)
- Auto-assigned IP address:** 3.92.164.14 [Public IP]
- IAM Role:** -
- IMDSv2:** Required

Networking Details:

- Public IPv4 address:** 3.92.164.14 [open address]
- Instance state:** Running
- Private IP DNS name (IPv4 only):** ip-172-31-43-165.ec2.internal
- Instance type:** t2.large
- VPC ID:** vpc-0956d36a20a49f03b
- Subnet ID:** subnet-0c8b7d92aa275493b
- Instance ARN:** arn:aws:ec2:us-east-1:043612820730:instance/i-070a7667ca4fe9ce3

Private IPv4 addresses: 172.31.43.165

Public IPv4 DNS: ec2-3-92-164-14.compute-1.amazonaws.com [open address]

id

Ubuntu

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.Load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.
- They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers `a2enmod`, `a2dismod`, `a2ensite`, `a2dissite`, and `a2enconf`, `a2disconf`. See their respective man pages for detailed information.
